

Distortion Portal

- Introduce.
- Properties of shader.

Introduce

- This shader is made with twirl rotate and distortion. Since the distortion is based on the environment texture, it can be used in most environments, but the first release will only allow compatibility in built-in environments, and will update as soon as possible.

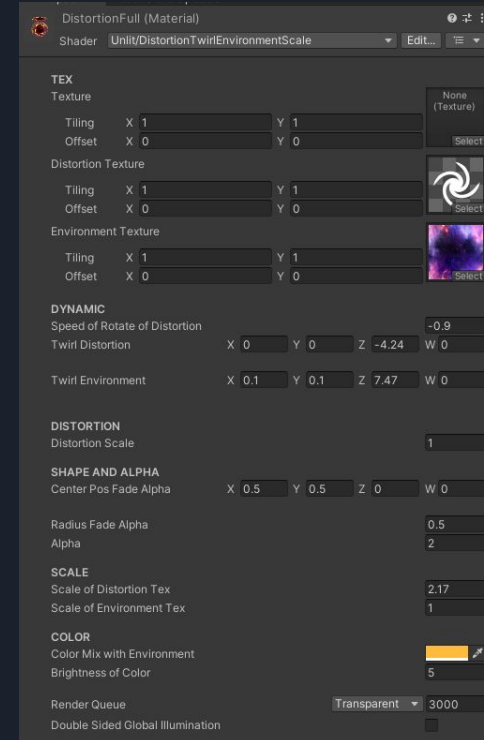

Properties of shader

- Here are some shader properties. I have separated these properties into individual shaders for optimal usage.

Properties of shader

- Tex zone includes 3 textures - Main texture, Distortion Texture, Environment texture - meaning as the name.
- Dynamic zone - dynamic zone is the area that controls the shader's animations. There are currently two main animations: twirl rotate of the distortion texture and of the environment texture.

Properties of shader

- Distortion zone is the area that adjusts the distortion ratio of the distortion texture on the environment.
- Shape And Alpha is the area that controls the shader's transparency and display radius - allowing the shader to fade from inside to outside based on the radius.
- Scale and Color are the areas that control the scale and color of the textures.
